DIRECTIONS FOR USE

Sweet Potato

Apply Reflex Herbicide at 1.0 pint per acre as a soil-surface application prior to sweet potato transplanting and before target weeds have emerged to provide residual control of broadleaf weeds including Palmer amaranth. Yellow nutsedge will be partially controlled by a pre-transplanting soil-surface application of Reflex Herbicide prior to emergence and will desiccate top growth of emerged yellow nutsedge. Partial control and desiccation means significant herbicidal activity, but not always at a level considered acceptable for commercial weed control. Refer to the Reflex Herbicide federal label for a complete list of weeds controlled.

Reflex Herbicide should not be used as a standalone herbicide treatment but as one component in an integrated weed management program.

Reflex Herbicide may be tank-mixed with other herbicide products registered for pre-transplanting use in sweet potato. See restrictions below.

Ground Applications: Use a minimum of 10 gallons per acre. Nozzle selection should meet manufacturer's output and pressure recommendations for preemergence applications.

Precautions:

- Sweet potato cultivars may vary in their response to Reflex Herbicide. When using Reflex Herbicide for the first time on a particular variety, always determine crop tolerance before using.

Restrictions:

- Do not apply more than 1 pint of Reflex Herbicide per acre per year.
- Do not make more than one Reflex Herbicide application per year.
- Do not apply Reflex Herbicide within 70 days of harvest.
- Do not apply Reflex Herbicide and Valor to the same field.

Rotational Crops:

- Sweet potato may be planted the following season after a Reflex Herbicide application. For all other rotational crops, refer to the **Rotational Crop Restrictions** section of the Reflex Herbicide federal label for appropriate plant back intervals.
